According to the ONF procedure, clones that display the same hybridisation matrix with a battery of 200 8mer oligonucleotides are grouped into clusters. One clone per ONF cluster is selected for sequencing. The size of each cluster is an indicator of the frequency of a transcript in the analysed library. The cluster size as well as the coordinates of the other clones assigned to the same ONF cluster as the clone from which the above EST is generated is available at the sea urchin project web site at: http://www.molgen.mpg.de/ag_seaurchin/.cDNA clones and filters are distributed via the Resource Center/Primary Database of the German Human Genome Project (http://www.rzpd.de)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Poustka, A.J., Groth, D., Hennig, S., Thamm, S., Cameron, A., Bec Reinhardt, R., Herwig, R., Panopoulou, G. and Lehrach, H. The suffix '.rev' indicates a reverse sequencing read of the insert. It does not necessarily reflect the orientation of the insert. Plate: CABA 0013 row: p column: 21
High quality sequence stop: 756.

                                                                                                                                                                                                                                    (bases 1 to 764)
                                                                                                                                                                                                                                                                                                                                          Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and Stratascript reverse transcriptase. After ligation of EcoRI adapters (5'-AATTCGGCACGAGG-3') followed by kinasing adapters and by XhoI digestion, the cDNA was size selected by chromatography on Sepharose CL-2B columns and fractions containing cDNAs larger than 1000 bp were ligated into EcoRI/XhoI-digested pCS107. Reference for library construction: Current Genomics 4, 635-644. Library constructed by Michelle Tabb and Bruce Blumberg (Dept of constructed by Michelle Tabb and Bruce Blumberg)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /tissue_type="Kidney"

The v + 1 method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              C.G., and Diamond, L.S. (1993) Entamoeba histolytica method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give

K New expression vector containing gene(s) that encode a poly-gamma-glutamate synthetase complex, useful for producing proteins (e.g. vaccines or enzymes) on the microbial surface of Gram-positive and/or Gram-negative bacteria.

Claim Page 111; 122pp; English

The invention relates to a vector for expression of a target protein on a microbial cell surface. The vector of the invention comprises either one

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antigens, antibodies, attachment proteins or adsorption proteins. Proteins recombinantly produced using the vector of the invention can used as, for example, vaccines or enzymes. The present sequence represents the Bacillus subtilis pgsBCA complex gene pgsC, which is specifically claimed for use in the vector of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or more than two genes of the Bacillus subtilis poly-gamma-glutamate synthetase complex (pgsBCA) to facilitate microbial surface expression of the target protein. The pgsBCA gene complex comprises the pgsB, pgsB and pgsA genes and is normally expressed in the outer membrane of Bacillus subtilis. The vector can be transformed into either Gram-positive or Gram-negative bacteria (e.g., Escherichia coli), and can be used for the surface expression of various proteins of interest such as enzymes,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New vector containing pgs A-C genes encoding poly-gamma-glutamate synthetase complex and an antigen protein gene of human papilloma virus, useful in preparing vaccine for treating or preventing mucosal tumor, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a vector for preparing a vaccine which contains one or more than two genes, i.e. pgs A-C encoding poly-X-glutamate synthetase complex and an antigen protein gene of human papilloma virus. The vector and microbes transformed with it are useful in preparing vaccines for treating or preventing mucosal tumour, e.g. cervical cancer. The present sequence is a Bacillus subtilis poly-X-glutamate synthetase complex coding sequence.

An expression vector pHCEILB:pgsA-P5 comprises one or more genes encoding poly-gamma-glutamic acid synthase selected from pgsB, pgsC and pgsA, and a gene for dipplar peptide antibiotics having antimicrobial, antifungal and anticancer activities, wherein the dipplar peptide antibiotic has homology to the peptide P5 encoded by the nucleotide sequence set forth in ADV65737. The present sequence represents the B. subtilis poly-gamma-glutamic acid synthase C gene used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure;

                                                                                                       The invention relates to a vector for expression of a target protein on a microbial cell surface. The vector of the invention comprises either one or more than two genes of the Bacillus subtilis poly-gamma-glutamate synthetase complex (pgsBCA) to facilitate microbial surface expression of the target protein. The pgsBCA gene complex comprises the pgsB, pgsB and pgsA genes and is normally expressed in the outer membrane of Bacillus subtilis. The vector can be transformed into either Gram-positive or Gram engative bacteria (e.g., Escherichia coli), and can be used for the surface expression of various proteins of interest such as enzymes, antigens, antibodies, attachment proteins or adsorption proteins. Proteins recombinantly produced using the vector of the invention can be used as, for example, vaccines or enzymes. The present sequence represents a microbial cell surface expression vector of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sung
                                                                                                                                                                                                                                                                                                                                                                    New expression vector containing gene(s) that encode a poly-gamma-glutamate synthetase complex, useful for producing proteins (e.g. vaccines or enzymes) on the microbial surface of Gram-positive and Gram-negative bacteria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  09-AUG-2002; 2002WO-KR001522.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5
                                                  The present sequence encodes an enzyme which is useful in the production of poly-gamma-L-glutamic acid (L-PGA) or poly-gamma-D,L-glutamic acid (PGA). A plasmid comprising the present sequence may be used to transform Escherichia coli. The transformants express the enzyme and PGA is produced in the culture
                                                                                                                                                                                                                                                                  New nucleic acid encoding a glutamate racemase enzyme useful for preparation of poly-gamma-glutamic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Seguence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence encodes a glutamate racemase enzyme which is useful in the production of poly-gamma-L-glutamic acid (L-FGA) or poly-gamma-D,L-glutamic acid (FGA). A plasmid comprising the present sequence may be used to transform Escherichia coli. The transformants express the enzyme and FGA is produced in the culture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1;

CC The invention describes a method of monitoring differential expression of CC genes in a first Bacillus cell relative to expression of the genes in CC genes in a first Bacillus cells comprising hybridising labelled nucleic acid probes is isolated from Bacillus cells to a substrate containing array of Bacillus CC genomic sequenced tags (GST), examining the array, and determining CC relative gene expression by an observed hybridisation reporter signal of CC a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cells. The method is useful for monitoring new CC genes in a first Bacillus cells. The method is useful for monitoring new CC global expression of several genes from a Bacillus cell, discovering new CC genes, identifying possible functions of unknown open reading frames and CC in which Bacillus cells adapt to changes in culture conditions, CC environmental stress or other physiological provocation. Extensive follow up characterisation is unnecessary, when one spot on an array eguals one compens or one open reading frame, since sequence information is available. This sequence represents a genomic sequence tag (GST) used in the method compart of the printed specification, but was obtained in electronic format compared to the printed specification, but was obtained in electronic format compared to the printed specification, but was obtained in electronic format compared to the printed specification, but was obtained in electronic format compared to the printed specification, but was obtained in electronic format compared to the printed specification, but was obtained in electronic format compared to the printed specification, but was obtained in electronic format compared to the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacil cells, by using substrate containing Bacillus genomic sequenced tag

                                                                                                                                     δ
                                                                                                                                                                                                                                                                                                                                                                                                              CC (II), given in AAGS1454 to AAGS3120, from Staphylococcus epidermidis. (I) cand (II) can have antibacterial activity and therefore can be used in CC and (II) can have antibacterial activity and therefore can be used in CC vaccination. The nucleic acids (I) may be used to produce the S. CC epidermidis polypeptides (II) via the production of vectors containing CC them which are used to produce hosts cells which express the CC used to vaccinate subjects and to raise antibodies against the bacteria. CC The polypeptides may also be used to assay for other inhibitors of their CC cativity and therefore identify compounds that may be used for the CC AAH55090 represent operationally claimed S. epidermidis genomic DNA CC polynucleotide sequences from the present invention. AAH55091 to AAH55090 represent objectically claimed S. epidermidis genomic DNA CC polynucleotide sequences and primers which are used in the CC exemplification of the present invention. N.B. The present invention CC sequence listing of the present specification, however the sequence CC listing only goes up to SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4465 to 4472, no sequences are present
                                                                                                                                                                                                                                            Query Match

Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections

Disclosure; SEQ ID NO 1666; 267pp; English.

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site

IJ NO 1269; 741pp; English

The invention describes an isolated nucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and encoding an Staphylococcus epidermidis polypeptide with any co of 3772 fully defined amino acid sequences (SEQ ID NO: 3772-7544) as comprising an incleotide sequences (SEQ ID NO: 3772-7544) as comprising a nucleotide sequence of SEQ ID NO: 3772-7544) as comprising a nucleotide sequence of a solated nucleic acid comprising a nucleotide sequence of at least 8 nucleotides in length; a comprising a nucleic acid cited above and a carrier; treating composition for prevention or treatment of an S. epidermidis comprising a nucleic acid cited above and a carrier; treating a subject for S. epidermidis infection; a recombinant or substantially curve preparation of an S. epidermidis polypeptide or its fragment; a computer presence of a staphylococcus nucleic acid in a sample; a computer readable medium having recorded in it the nucleotide sequences with SEQ ID NO: 1-3772 or its fragments; a computer based commercial importance; a computer based system for identifying fragments of the Staphylococcus plasmids of commercial importance; of a computer based commercially important nucleic acid fragments of the Staphylococcus genome of the Staphylococcus plasmids; and identifying an expression modulating fragment confiction and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus genome and/or plasmids. The methods and confiction and or treatment of an Staphylococcal epidermidis bacterial confiction. This sequence encodes a S. epidermis protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II) given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. chief the subject of the which are used to produce hosts cells which express the polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their cativity and therefore identify compounds that may be used for the cativity and therefore identify compounds that may be used for the CC AAH55090 represent specifically claimed S. epidermidis genomic DNA CC polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the camerifically claimed S. epidermidis genomic DNA CC exemplification of the present invention. N.B. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
The present invention describes an isolated polynucleotide (I) of CR Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. CR Alloiococcus otitidis is a Gram-positive bacterium. Also described: (1) CR an isolated polypeptide that is encoded by the polynucleotide (I); (2) an CR complement, degenerate variant or fragment; (3) a genetically engineered CR complement, degenerate variant or infected with the vector of (2); (2) an antibody specific for the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide, its complement, biological CR composition comprising the polypeptide, its complement, biological CR capression vector; (6) a pharmaceutical composition comprising the cR capression vector; (6) a pharmaceutical composition comprising an array CR containing against Alloiococcus otitidis by administering to a host the immunogenic composition; (9) detecting and/or identifying Alloiococcus otitidis in the biological sample; (10) a kit comprising a container CR containing the novel polynucleotide, its degenerate variant or fragment, CR containing the movel polynucleotide, its degenerate variant or fragment, CR containing the movel polynucleotide, its degenerate variant or fragment, CR containing the movel polynucleotide, its degenerate variant or fragment, CR containing the movel polynucleotide, its degenerate variant or fragment, CR containing the movel polynucleotide, its degenerate variant or fragment, CR containing the container container containing the container 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Alloiococcus otitidis; antigenic protein; immunogenic; immunisation; gene therapy; Gram-positive bacterium; infection; gene; ds.

The polynucleotides are useful for expressing and detecting Alloiococcus otitidis. The present sequence encodes an Alloiococcus otitidis antigen

New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring effects during drug clinical trials.
                                                                                                                                                         of.

NO 49; 1019pp; English

The present invention describes an isolated 'polynucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. CC Alloiococcus otitidis is a Gram-positive bacterium. Also described: (1) CC an isolated polypeptide that is encoded by the polynucleotide (I); (2) an isolated polypeptide that is encoded by the polynucleotide (I); (2) an expression vector comprising the novel isolated polynucleotide (I); its complement, degenerate variant or fragment; (3) a genetically engineered complement, degenerate variant or fragment; (3) a genetically engineered composition comprising the polypeptide of (1); (5) an immunogenic composition comprising the polypucleotide that is comprised in the composition comprising the polypucleotide that is comprising the polypeptide of (1) and a carrier; (7) a protein chip comprising an array of the polypeptides of (1), their biological equivalent or fragment; (8) communising against Alloiococcus ortitidis by administering to a host the immunogenic composition; (9) detecting and/or identifying Alloiococcus ortitidis in the biological sample; (10) a kit comprising a container containing the novel polynucleotide, its degenerate variant or fragment; (7) the antibody of (4); and (11) producing a polypeptide by culturing the polypeptide, polypeptides, antibodies and compositions of the present convention can be used for treating and diagnosing diseases, drug container or polynucleotides, polypeptides, antibodies and compositions of the present contitions. The present sequence encodes an Alloiococcus otitidis antigen contitions antigen produces are useful for expressing and detecting Alloiococcus otitidis. The present invention.

CC Allolococcus citidis genomic DNA, which encodes an antigenic protein.
CC Allolococcus citidis is a Gram-positive bacterium. Also described: (1)
CC an isolated polypeptide that is encoded by the polynucleotide (1); (2) an cc expression vector comprising the novel isolated polynucleotide (1), its complement, degenerate variant or fragment; (3) a genetically engineered complement, degenerate variant or fragment; (3) a genetically engineered complement, degenerate variant or fragment; (3) a genetically engineered composition comprising the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide its complement, biological composition vector; (6) a pharmaceutical composition comprising an array of the polypeptide of (1), their biological equivalent or fragment; (8) composition comprising an array of the polypeptide of (1), their biological equivalent or fragment; (8) communising against Alloicoccus otitidis by administrating to a host the contitides in the biological sample; (10) a kit comprising a container contitidis in the hovel polypucleotide, its degenerate variant or fragment; (6) or the antibody of (4); and (11) producing a polypeptide by culturing the collure (1) can be used in gene therapy. The collure (1) can be used in gene therapy. The convention can be used for treating and diagnosing diseases, drug
                                                                                                                                                                                                                                                                                                                                                                                                  New Alloiococcus otitidis polynucleotides and polypeptides, useful treating and diagnosing diseases, drug screening assays and monitor effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alloiococcus ogene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               29-NOV-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP55124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. NB. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polypeptide, useful for diagnosing and treating bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 198 BP; 61 A; 51 C; 29 G; 57 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; SEQ ID NO 1489; 267pp; English.
